

Implement a retry mechanism for a function using decorators and exception handling.

```
def retry(times=3):
    def decorator(func):
        def wrapper(*args, **kwargs):
            attempt = 1
            while attempt <= times:
                try:
                    return func(*args, **kwargs)
                except Exception as e:
                    print(f"Attempt {attempt} failed : {e}")

                    if attempt == times:
                        print("All reties failed ")
                        raise
                    attempt += 1

            return wrapper

        return decorator

    return decorator

@retry(times=4)
def task():
    task.count += 1
    if task.count < 3:
        raise ValueError("Temporary error occured.")
    return "Success"

task.count = 0

print(task())
```

```
Attempt 1 failed : Temporary error occurred.  
Attempt 2 failed : Temporary error occurred.  
Success
```

```
Process finished with exit code 0
```
