

SEO Technical Audit Report

Issue Focus: Duplicate Page Titles & Canonical Conflicts

Website Audited:	https://www.techno.academy/
Issue Investigated:	URLs with duplicate page titles
Pages Sampled:	25+ URLs across navigation, program hubs, and course pages
Overall Result:	ISSUE CONFIRMED

Original Issue Description (from audit tool)

URLs with duplicate page titles

Duplicate <title> tags prevent search engines from understanding which site page is relevant to a particular search query. Pages with duplicate titles are much less likely to rank well.

Executive Summary

The duplicate-title issue is confirmed on techno.academy. The root cause is architectural: the domain is currently running **two separate, fully live websites in parallel** — a newer platform (titles formatted "*Page Name | Techno Dot Academy*") and a legacy WordPress site (titles formatted "*Page Name - Techno Dot Academy*"). Several important URLs are inconsistently routed between the two systems, and in multiple cases a brand-new page's own canonical tag incorrectly points to a completely different, older URL. This produces overlapping/duplicate title signals, splits ranking authority across two pages competing for the same keyword, and misleads crawlers about which page is authoritative.

Four confirmed cases are detailed below. Because the pattern repeats identically each time it was tested, it is highly likely additional legacy URLs across the site (business/vendor certifications, university degree pages, etc.) share the same defect — a full crawler run (Screaming Frog / Ahrefs Site Audit) is recommended to produce an exhaustive list; see Scope & Recommendations at the end of this report.

Confirmed Findings

Finding 1: /cloud vs /cloud-computing (Cloud Computing course)

URL	Title Tag Found	Notes
techno.academy/cloud	Cloud Computing Techno Dot Academy	New-platform page. Canonical tag incorrectly points to /cloud-computing.
techno.academy/cloud-computing	Cloud Computing - Techno Dot Academy	Legacy WordPress page with entirely different design/content. This is the URL every internal nav link and the /cloud-devops hub page actually points to.

What's happening: Two live, indexable URLs cover the exact same course topic with nearly identical titles. Worse, the new page's canonical tag falsely declares the old, different page as the "true" version — a broken canonicalization that confuses search engines about which page to index and rank.

Recommended fix: Pick one authoritative URL (recommend **/cloud-computing**, since that's what internal links already use), 301-redirect the other, retire the duplicate template, and remove/correct the incorrect canonical tag.

Finding 2: /ui-ux-design vs /ui-ux-designing (UI/UX Design course)

URL	Title Tag Found	Notes
techno.academy/ui-ux-design	UI/UX Design Professional Techno Dot Academy	New-platform page. Canonical tag incorrectly points to /ui-ux-designing.
techno.academy/ui-ux-designing	UI/UX Designing - Techno Dot Academy	Legacy WordPress page, different content and layout entirely.

What's happening: Identical pattern to Finding 1: a modern page's canonical tag points at an unrelated legacy URL instead of itself, creating a false duplicate-content signal between two live pages targeting the same keyword.

Recommended fix: Set /ui-ux-design's canonical to reference itself (self-canonical), then 301-redirect the legacy /ui-ux-designing page into it, or vice-versa if the legacy page has better backlinks/rankings worth preserving.

Finding 3: /digital-marketing silently collapses into the category page

URL	Title Tag Found	Notes
techno.academy/digital-marketing	Design & Marketing Courses in Calicut Techno Dot Academy	Redirects to /design-marketing and inherits its title. The specific "Skill Diploma In Digital Marketing" course page no longer exists at this URL.

techno.academy/design-marketing	Design & Marketing Courses in Calicut Techno Dot Academy	This is the category/hub page. Both /programs and /design-marketing itself still link to /digital-marketing as if it were a distinct course page.
---	--	---

What's happening: Internal links across the site ("View Details" on the Digital Marketing course card) promise a dedicated course page but deliver the generic category page instead — a broken user path that also wastes a unique title-tag opportunity on a page that should be describing one specific program.

Recommended fix: Either rebuild a real, unique course page at /digital-marketing with its own title/content, or update every internal link currently pointing to /digital-marketing so it correctly points straight to /design-marketing.

Finding 4: /angular serves orphaned legacy content

URL	Title Tag Found	Notes
techno.academy/angular	Angular - Techno Dot Academy	Full legacy WordPress template — different nav, design, and an outdated set of internal links (/mca, /bba, /frm, /cfa, etc.).
Referenced by new-site nav as	"Python Django - Angular Full Stack"	The main navigation on every new-site page links to /angular expecting the modern course-page template, but /angular has not been migrated.

What's happening: The page functions, but breaks the site's information architecture and title-format consistency (hyphen vs. pipe separator), and links out to stale legacy pages that don't match current course offerings.

Recommended fix: Rebuild /angular using the same template as /mern, /mean and /flutter (already correctly migrated), or 301-redirect it to the closest live equivalent, e.g. /python-django-next-js-full-stack.

Methodology

Pages were fetched directly (rendering their actual HTML <head> output) rather than relying on cached search snippets, so the title tags, canonical tags, and content shown above reflect what a search engine crawler would see at the time of this audit. The homepage and /programs page were used to map the site's navigation and enumerate course/category URLs; suspicious naming pairs (near-duplicate slugs, category-vs-course overlaps, and legacy nav links surfaced inside old WordPress pages) were then fetched and compared directly.

Scope & Recommendations

- Run a full crawl with Screaming Frog or Ahrefs Site Audit across both techno.academy and any legacy subdomain (e.g. wp.techno.academy) to generate the complete, exhaustive duplicate-title list. Manual sampling found 4 confirmed cases from ~25 pages checked out of 100+ total URLs discovered.
- The legacy WordPress pages referenced dozens of additional old URLs not yet checked in this pass (business/vendor certifications: /zoho, /odoo, /google, /microsoft-certificate-courses; finance certs: /frm, /cfa, /cima, /ifrs, /acca, /ca, /cma; university tracks: /bca, /mca, /bba, /bcom, /mcom, /mba, /ba, /ma). Given the identical pattern found in all four tested cases, these are worth checking next.
- Standardize on a single title-tag format ("Page Name | Techno Dot Academy") site-wide once the legacy pages are retired or migrated.
- Audit every canonical tag on the new platform to confirm it points to itself, not to a legacy URL — this appears to be a systemic template bug, not a one-off mistake.
- After consolidating duplicate URLs, add 301 redirects (not just canonical tags) from retired URLs to their surviving counterparts to preserve any existing search rankings and backlinks.
